(57) Abstract: An ultrasonograph comprising a probe for measurement by bringing the probe into contact with a subject in a first state, first image creating means for creating a first image of the subject from the information sent from the probe, image display means for displaying the first image created by the first image creating means, means for setting at least one piece of reference information on the first image displayed by the image displaying means, second image creating means for creating a second image of the subject from the measurement information collected by bringing the probe into contact with the subject in a second state different from the first state, means for collecting information on the distortion of a desired region of interest in the second image on the basis of the variation, in the second image, of the reference information set on the first image by the setting means, and display control means for controlling the display of the distortion information collected by the distortion collecting means on the image display means.
